

Dialectics of nature

Dialectics of Nature is an unfinished 1883 work by Frederick Engels that applies Marxist ideas particularly those of dialectical materialism to science. In his 1939 preface to the work, the biologist J. B. S. Haldane states most of the manuscript seems to have been written between 1872 and 1882, that is to say it refers to the science of that era. Hence it is often hard to follow if one does not know the history of the scientific practice of that time. The idea of what is now called the conservation of energy was beginning to permeate physics, chemistry and biology, but it was still very incompletely realised, and still more incompletely applied. Words such as force, motion, and vis viva were used where we should now speak of energy. Some then controversial topics of Engels day, pertaining to incomplete or faulty theories, are now settled, making some of Engels essays dated. Their interest lies not so much in their detailed criticism of theories, but in showing how Engels grappled with intellectual problems. One law proposed in the Dialectics of Nature is the law of the transformation of quantity into quality and vice versa. Probably the most commonly cited example of this is the change of water from a liquid to a gas, by increasing its temperature (although Engels also describes other examples from chemistry). In contemporary science, this process is known as a phase transition. There has also been an effort to apply this mechanism to social phenomena, whereby population increases result in changes in social structure. Dialectics and its study was derived from the philosopher G. W. F. Hegel, who, in turn, had studied the Greek philosopher Heraclitus. Heraclitus taught that everything was constantly changing and that all things consisted of two opposite elements which changed into each other as night changes into day, light into darkness, life into death etc. Engels work develops from the comments he had made

about science in Anti-Duhring. It includes the famous The Part Played by Labour in the Transition from Ape to Man, which has also been published separately as a pamphlet. Engels argues that the hand and brain grew together, an idea supported by later fossil discoveries. Must read philosophy book, to understand about dialectical materialism.
